PROJECT REPORT : STREAMLINING TICKECT ASSIGNMENT FOR EFFICIENT SUPPORT OPERATIONS

1. INTRODUCTION

1.1 Project Overview

The project "Streamlining Ticket Assignment for Efficient Support Operations" focuses on improving the process of assigning support tickets in an organization. It aims to automate and optimize ticket distribution to the appropriate support agents based on priority, category, and availability. This reduces manual effort and improves response time.

1.2 Purpose

The main purpose of this project is to enhance operational efficiency by minimizing delays, avoiding misallocation of tickets, and ensuring faster issue resolution. It also helps in improving customer satisfaction and resource utilization.

2. IDEATION PHASE

2.1 Problem Statement

Manual ticket assignment leads to delays, errors, and uneven workload distribution among support agents. There is a need for an automated system that assigns tickets efficiently.

2.2 Empathy Map Canvas

- Users want quick issue resolution

- Support agents need clear task allocation
- Managers need performance tracking
- Customers expect timely responses

2.3 Brainstorming

- Use automation for ticket assignment
- Apply priority-based routing
- Use AI/logic-based classification
- Implement dashboard monitoring

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Customer raises a ticket → Ticket is logged → System analyzes category → Ticket is assigned → Agent resolves → Feedback collected.

3.2 Solution Requirement

- Automatic ticket classification
- Priority-based assignment
- Agent availability tracking
- Real-time notifications

3.3 Data Flow Diagram

- Input: User ticket → Processing: Classification & assignment → Output: Assigned ticket to agent → Feedback loop.

3.4 Technology Stack

- Frontend: HTML, CSS, JavaScript
- Backend: Python / Java / Node.js
- Database: MySQL
- Tools: APIs, Automation tools

4. PROJECT DESIGN

4.1 Problem Solution Fit

The system directly addresses inefficiencies in manual ticket assignment by automating the process and ensuring optimal resource usage.

4.2 Proposed Solution

Develop a centralized system that automatically assigns tickets using predefined rules like priority, category, and agent workload.

4.3 Solution Architecture

- User Interface for ticket creation
- Backend processing system
- Database for storing tickets
- Assignment engine
- Notification system

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

- Requirement gathering

- System design
- Development phase
- Testing phase
- Deployment

6. FUNCTIONAL AND PERFORMANCE TESTING

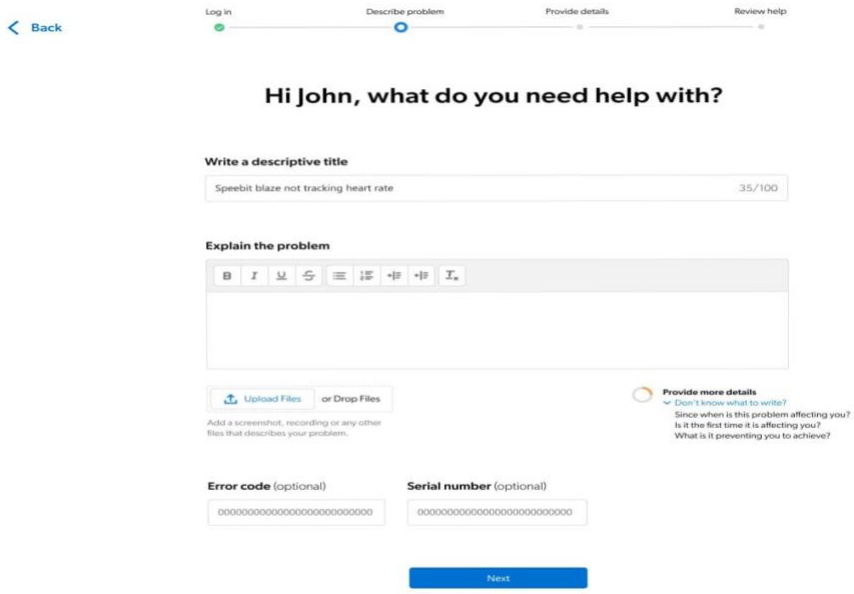
6.1 Performance Testing

- Test system response time
- Check load handling capacity
- Validate assignment accuracy
- Ensure system reliability

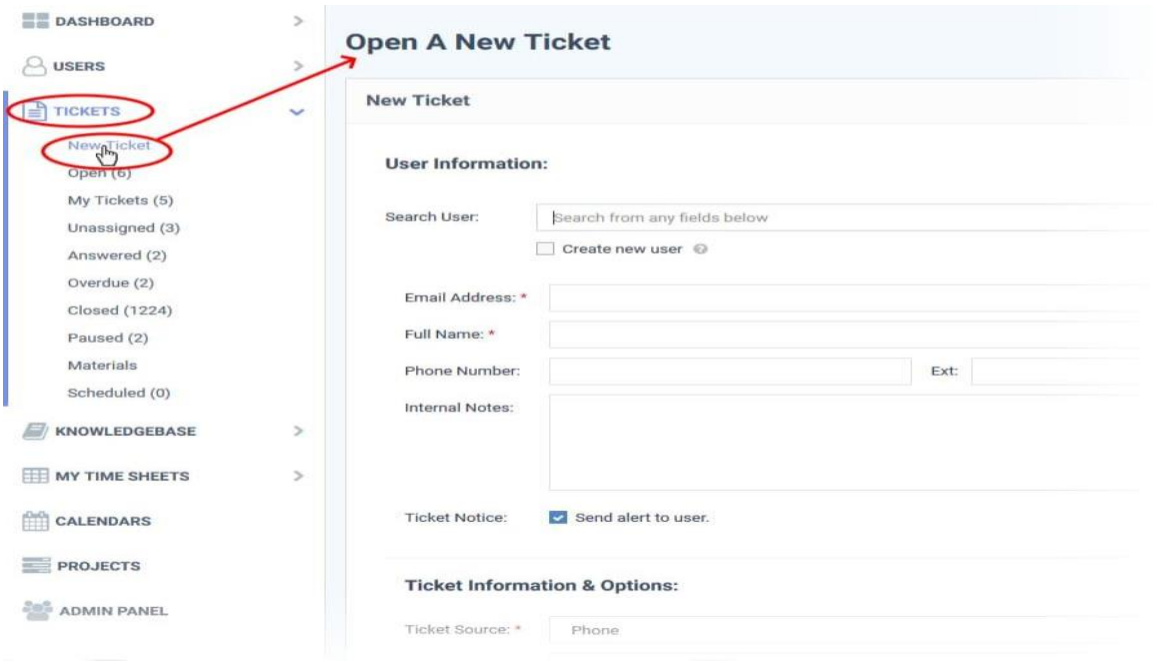
7. RESULTS

7.1 Output Screenshots

- Ticket creation page



- Assignment dashboard



- Agent workload view
- Final resolution output

8. ADVANTAGES & DISADVANTAGES

Advantages

- Faster ticket resolution
- Reduced manual effort
- Better workload distribution
- Improved customer satisfaction

Disadvantages

- Initial setup complexity
- Requires proper data configuration
- Dependency on system accuracy

9. CONCLUSION

The project successfully improves support operations by automating ticket assignment. It enhances efficiency, reduces delays, and ensures better resource management.

10. FUTURE SCOPE

- Integration with AI for smart predictions
- Chatbot-based ticket creation
- Advanced analytics and reporting
- Cloud-based scalability

11. APPENDIX
